

PROJECT DELIVERABLE

Current Process Analysis Report

Implementing a Digital Guest Service & Feedback System for 'The Urban Oasis'

Deliverable	#1	Due	Week 1
Project Type	Group Project	Project Status	85%
Prepared By	_____	Date	_____
Document Focus	Current Process Analysis	Property	The Urban Oasis

Figure 1. Existing guest-service workflow and major digitalization opportunity.

1. Executive Summary

This report analyzes the current guest-service and feedback process at The Urban Oasis. The existing workflow is assumed to rely heavily on front-desk communication, telephone calls, verbal handoffs, and manual follow-up between departments. While this approach can work during low-volume periods, it becomes difficult to manage consistently when guest requests increase or when several departments are involved.

The analysis identifies the main operational pain points and converts them into functional requirements for a proposed digital guest service and feedback system. The goal is to create a single, trackable workflow for guest requests, ownership, service status, escalation, and feedback while improving response times and management visibility.

Deliverable Objective

Document the current guest-service workflow, identify operational pain points, and define the functional requirements that a new digital guest-service and feedback system should satisfy.

2. Scope of the Analysis

- Guest requests received through the front desk, phone calls, or direct staff interaction.
- Recording and assigning guest requests to operational departments.
- Coordination between front office, housekeeping, maintenance, food and beverage, and guest relations.
- Tracking request status, delays, and escalations.
- Communicating progress and resolution back to the guest.
- Collecting guest feedback and using it for service-quality improvement.

3. Current Guest Service Workflow

1. Guest raises a request or complaint: A guest contacts the front desk, calls the hotel, or directly approaches an employee.

2. Staff records or remembers the request: The request may be written in a logbook, communicated verbally, sent through a call/message, or remembered by the employee.

3. Request is passed to the responsible department: Front-office staff contact housekeeping, maintenance, food and beverage, or another team depending on the issue.

4. Department works on the request: The responsible employee completes the task, but status visibility may remain limited outside the department.

5. Front office follows up manually: Staff call or message the department to ask whether the task has been completed.

6. Guest receives an update: The guest may be informed once the front office confirms the status.

7. Feedback is collected: Feedback may be given verbally, during checkout, through a survey, or through an external review platform.

4. Current-State Process Assessment

Process Area	Current Method	Observed Risk	Impact
Request capture	Phone, desk interaction, manual notes	Requests may be missed, duplicated, or recorded inconsistently.	Reduced reliability
Task assignment	Verbal or phone-based handoff	No clear ownership or automatic acknowledgement.	Delayed action
Status tracking	Manual follow-up with departments	Front desk cannot instantly see progress.	Longer response time
Escalation	Depends on staff judgement	Urgent or overdue issues may not be escalated consistently.	Guest dissatisfaction
Guest updates	Staff remember to call or speak to guest	Guest may not receive timely progress updates.	Poor transparency
Feedback capture	Checkout comments or separate surveys	Feedback is fragmented and not always linked to the service request.	Limited insights
Reporting	Manual review or scattered records	Difficult to measure response time, recurring issues, or department performance.	Weak decision support

5. Key Pain Points Identified

Fragmented communication: Requests can move across calls, verbal instructions, notebooks, or messaging channels, making the service history difficult to trace.

Lack of a single source of truth: There is no centralized place where front-office staff can see every active guest request and its current status.

Unclear ownership: A request may be passed to a department without a clearly identified employee or accountable owner.

Slow follow-up: Front-office staff may repeatedly contact departments to check progress instead of seeing live status updates.

Inconsistent prioritization: Routine requests and urgent complaints may be handled through the same informal process without clear priority levels.

Delayed escalation: Overdue or high-impact requests may depend on manual judgement before reaching a supervisor or duty manager.

Limited guest visibility: Guests may not know whether their request has been accepted, assigned, delayed, or completed.

Fragmented feedback: Guest feedback may be collected separately from the service request that caused the experience.

Limited performance data: Management cannot easily compare response times, resolution rates, recurring complaint types, or department performance.

Risk during peak periods: Manual coordination becomes harder when many guests submit requests at the same time.

6. Root-Cause Summary

Root Cause	Example	Resulting Problem
Manual information flow	Staff rely on calls or verbal handoffs.	Requests can be lost or delayed.
No standardized workflow	Different employees manage requests differently.	Inconsistent service experience.
No shared status view	Front office must ask departments for updates.	Time is wasted on follow-up.
No automated escalation	Overdue tasks are not highlighted automatically.	Critical issues may remain unresolved.
Disconnected feedback data	Feedback is stored separately	Root causes are difficult to

	from request history.	analyze.
--	-----------------------	----------

7. Functional Requirements for the New Digital System

FR-01 Central Request Capture: The system should allow staff to create a guest-service request in one centralized platform.

FR-02 Guest Identification: Each request should be linked to the guest name, room number, stay details, or another appropriate identifier.

FR-03 Request Categorization: Staff should be able to classify requests such as housekeeping, maintenance, food and beverage, concierge, billing, complaint, or other.

FR-04 Priority Levels: Requests should support priority levels such as Normal, High, and Urgent.

FR-05 Automatic Assignment: The system should route or assign requests to the responsible department or employee.

FR-06 Ownership Tracking: Every active request should show a responsible owner and current status.

FR-07 Status Workflow: Requests should move through clear statuses such as New, Assigned, In Progress, Awaiting Guest, Resolved, and Closed.

FR-08 Time Tracking: The system should capture creation time, assignment time, response time, resolution time, and closure time.

FR-09 SLA / Due-Time Alerts: Staff and supervisors should receive alerts when a request is approaching or exceeding the expected service time.

FR-10 Escalation: High-priority or overdue requests should be escalated automatically to the appropriate supervisor or duty manager.

FR-11 Internal Notes: Staff should be able to add service notes and updates without exposing internal information to guests.

FR-12 Guest Notifications: Guests should receive suitable confirmations and progress updates through the selected communication channel.

FR-13 Feedback Collection: After resolution, the system should allow the guest to provide a rating and short feedback.

FR-14 Complaint Linking: Feedback and complaints should remain linked to the original service request for complete context.

FR-15 Dashboard: Front-office and management users should be able to view open, overdue, urgent, and recently resolved requests.

FR-16 Search and History: Authorized users should be able to search previous requests by guest, room, category, date, status, or department.

FR-17 Reporting and Analytics: The system should report request volume, average response time, resolution time, SLA compliance, satisfaction score, and recurring issues.

FR-18 Role-Based Access: Different users should receive permissions appropriate to front office, department staff, supervisors, and management.

8. Functional Requirement Prioritization

Priority	Requirements	Reason
Must Have	Request capture, guest identification, categorization, assignment, ownership, status tracking, priority, time tracking, escalation	Required to replace the fragmented manual workflow.
Should Have	Guest notifications, internal notes, search/history, dashboard, feedback capture	Improves visibility, communication, and service consistency.
Could Have	Advanced analytics, configurable SLA rules, deeper guest-preference insights	Adds optimization after the core workflow is stable.

9. Recommended Future-State Workflow

1. Guest request is entered into the digital system.
2. The request is categorized, prioritized, and automatically assigned.
3. The responsible employee acknowledges the task and begins work.
4. Status updates are visible to front office in real time.
5. The system alerts staff if the expected response or resolution time is at risk.
6. The guest receives appropriate progress communication.
7. The request is resolved and confirmed.
8. The guest receives a short feedback prompt.
9. Feedback and operational data are stored for reporting and continuous improvement.

10. Expected Benefits

- Fewer missed or duplicated guest requests.
- Clear accountability for every task.
- Faster front-office response and reduced manual follow-up.
- Consistent prioritization and escalation of urgent issues.
- Better communication with guests during service recovery.
- Centralized complaint and feedback history.

- Measurable service-quality indicators for management.
- Improved coordination between front office and operational departments.

11. Suggested Success Measures

KPI	What It Measures	Desired Direction
Average first-response time	Speed of acknowledgement	Decrease
Average resolution time	Speed of full service completion	Decrease
SLA compliance	Requests completed within target time	Increase
Guest satisfaction score	Guest perception of service quality	Increase
Repeat complaint rate	Recurring unresolved service problems	Decrease
Overdue open requests	Backlog and operational risk	Decrease

12. Conclusion

The current guest-service process at The Urban Oasis contains several points where information can be delayed, lost, or difficult to track because coordination depends heavily on manual communication. The proposed digital system should therefore focus first on centralized request capture, clear ownership, real-time status tracking, prioritization, escalation, guest communication, and linked feedback.

These requirements establish a practical foundation for the next project deliverables, including the technology solution proposal, implementation and training plan, and service-quality monitoring framework.
